Technologies from Japan

- Energy Technologies
- Environmental Technologies
- Agribusiness Technologies
- Human Health Technologies

UNIDO NETWORK OF INVESTMENT AND
TECHNOLOGY PROMOTION OFFICES

TOKYO, JAPAN

As of February 2020

UNIDO ITPO Tokyo's Sustainable Technology Promotion Platform (STePP) is designed to share information on Japanese technologies that contribute to inclusive and sustainable industrial development.

Concept

UNIDO ITPO Tokyo promotes selected sound and productive Japanese technologies in order to accelerate the transfer of such technologies to developing and emerging countries.

Technologies registered on STePP tackle many issues and challenges faced by current societies striving for inclusive and sustainable industrial development. This includes energy technologies, environmental technologies, agribusiness technologies and human health technologies, all of which are provided by Japanese companies seeking to implement their technologies in developing and emerging countries.

STePP aims to become a platform where Japanese technology providers and governments/companies in developing and emerging countries can find partners for collaboration to achieve effective and sustainable technology transfer.

Criteria for Registration

The technologies are evaluated for registration on STePP by the UNIDO STePP Evaluation Committee based on the following criteria;

1. Applicability in Developing and Emerging Countries
2. Competitive Advantage
3. Conformity with UNIDO's Mandate of Industrial Development
4. Contribution to Sustainability
5. Technical Maturity

Categories of technologies promoted are listed in the next page. Foreign Direct Investment (FDI), Joint Ventures (JV), and licensing of technologies, etc. are some of the ways by which the technologies can be transferred.

Any organizations in developing and emerging countries, such as governmental organizations, private enterprises, institutions or NGOs, are welcome to approach the technology providers on STePP through the contact person listed below each technology.

Categories of UNIDO ITPO Tokyo's STePP

Energy Technologies

- Renewable energy (ex: solar, wind, geothermal, small hydro, biomass)
- Energy saving and energy storage (ex: co-generation, storage batteries, energy saving)
- Utilization of unused resources (ex: high-efficiency and low-emission fossil fuel utilization)

Environmental Technologies

- Pollution prevention and control (ex: pollution prevention of air, water and soil)
- Waste treatment and management (ex: industrial and municipal waste treatment)
- Circular economy (ex: 3R (reduce, reuse, recycle) related technologies)

Agribusiness Technologies

- Food value chain*¹ (ex: processing and quality control of food and drinks)
- Production enhancement (ex: soil conditioner)
- Adaptation to climate change (ex: drip irrigation system)
- Water resource management (ex: desalination, fresh water storage)

Human Health Technologies*²

- Public health (ex: drinking water supply, prevention of infection, toilets)
- Monitoring and diagnostic equipment (ex: simple equipment for health monitoring in remote areas)

*1: Processing, transportation, preservation or quality control of acceptable, except for real foods and drinks (beverages).

*2: It excludes pharmaceuticals, highly invasive medical devices for the human bodies, and folk remedies, etc.

For the detailed information please access
www.unido.or.jp/en/activities/technology_transfer/technology_db/

UNIDO ITPO Tokyo

UNIDO's Investment and Technology Promotion Office, Tokyo (UNIDO ITPO Tokyo) was established in March 1981 and is one of 9 offices worldwide belonging to UNIDO's ITPO Network.

UNIDO ITPO Tokyo's mission is to help developing countries and economies in transition in their efforts to achieve inclusive and sustainable economic development by promoting foreign direct investment (FDI) and technology transfer from Japan, through various promotion activities in Japan and also in recipient countries using UNIDO's private and public sector networks.

As of February 2020

Energy Technologies

- Renewable energy (ex: solar, wind, geothermal, small hydro, biomass)
- Energy saving and energy storage (ex: co-generation, storage batteries, energy saving)
- Utilization of unused resources (ex: high-efficiency and low-emission fossil fuel utilization)

NEW

Bamboo Chemical Laboratory, Ltd.

Energy saving and energy storage

3 Types of Small Hydropower Generator

Target Area

Rural electrification

Technology

The company's three types (Pelton, screw, undershot) of small-scale hydroelectric power generators are optimally applicable corresponding to the locational conditions such as water flow and head. The range of power generation output is 10kW or less. Compared to large-scale type, the initial cost and operation cost are relatively inexpensive. In general, it is appropriate to install in small and medium-sized irrigation canals.

Sample Projects

In total, 23 hydropower units of the three types have been installed. In developing countries, 1 unit of Pelton type in El Salvador, 3 units of screw-type in Myanmar and 1 unit of screw-type in the Philippines have been operating.

BGCT JAPAN K.K., Creative Co., Ltd.

Renewable energy
 [Environmental Technologies: Circular Economy]

Solid Recovered Fuel 'Green Coal' - RPPWF™

Target Area

Fossil fuels; Carbon dioxide emissions

Technology

"RPPWF™" is a promising alternative fuel resource to coal and oil, produced entirely from waste materials. It is made from non-hazardous, non-recyclable papers, plastics/plants and wood waste, and other household and industrial waste. Because RPPWF™ contains a lot of biomass, CO₂ emissions can be mostly reduced to zero. Also the combustion efficiency is much higher than coal and oil.

Sample Projects

Pilot production of RPPWF™ was successfully completed at the company's test plant.

Website: www.bgct.jp
 Contact: Mr. Michihiro KIYAMA info@bgct.jp

Biomaterial in Tokyo Co., Ltd.

Renewable energy

Ethanol Production through Yeast Fermentation

Target Area

Poor ethanol production

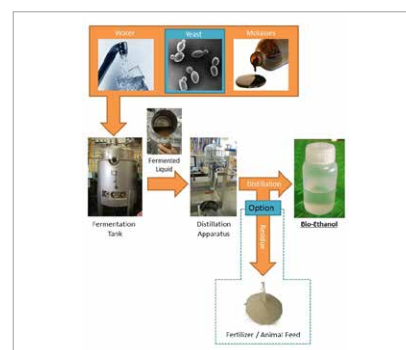

Technology

The company's strains of yeast used in fermentation process for converting sugars into ethanol have the advantages of being active in high sugar concentrations, low levels of impurities, and resistance to high temperatures. Using these strains of yeast can produce safe ethanol, not only as an alternative fuel, but also as a beverage additive.

Sample Projects

Several studies have been done at various universities in Japan and the tolerance of the yeasts to high temperatures has been tested in collaboration with the Starch Technology Center at the Agency for the Assessment and Application of Technology in Indonesia.

Contact: Mr. Yosuke KOBAYASHI kobayashi.y@biomt.onmicrosoft.com

Renewable energy
[Environmental Technologies: Circular Economy]

CR-POWER LLC

Biofuel and Waste Management: C-POWER PLANT

Target Area

Waste disposal; Energy production

Technology

C-POWER plant thermally decomposes organic carbon such as municipal solid waste and various biomass to produce fuel gas which can be utilized for electricity generation and chemical feedstock, in a continuous process. It consists of the 'horizontal rotating cylindrical kiln' (U-turn kiln) and the 'spiral cylinder interior horizontally rotating kiln' (Hybrid kiln) which enable high energy efficiency and low output of ash. C-POWER plant can generally treat 20kg of raw materials per hour.

Sample Projects

Starting with the development of the U-turn kiln in 2000, CR-POWER LLC proceeded to the construction of the pilot plant in 2004. In addition, the company invented the Hybrid kiln to enforce gasification reaction in 2012. There are three commercial C-POWER plants operating in Japan.

EiShin Co., Ltd.

Energy Efficient & Eco-Friendly Automobile Filter Spray

Target Area

Emission reduction from vehicles

Technology

“eco-SPRAY,” allows cleaner combustion in the car engines which translates into improved power and fuel efficiency as well as reduced emissions. The spray is applied to car air filters every 5,000-6,000 km to reduce harmful emissions and increase gas mileage, typically from 8-20%, while decreasing air pollution.

Sample Projects

Distributed in 15 countries since 2012: China, Thailand, Canada, USA, UAE, Romania, Korea, Cambodia, Vietnam, Iran, Philippines, Bangladesh, Nepal, Taiwan and Japan.

FUMIN Co., Ltd.

Energy saving and energy storage

Coating for Ultraviolet and Infrared Ray Shielding

Target Area

Ultraviolet rays; Building and vehicle temperature control

Technology

The ultimate solar control coating technology called FUMIN COATING™ forms an ultra-thin transparent film of 1.5 microns thickness that shuts off about 90% of ultraviolet rays and 70% of infrared rays. It can be applied on any type of curved or bumpy surface glass and polycarbonate. Because 85% of visible light transmission is achieved, the exterior appearance and interior brightness are not affected at all.

Sample Projects

5,000 construction projects have been completed during the past 10 years. This coating was also selected for The National Art Center of Tokyo covering 4,700 square meters glasses. In Singapore, it was verified that this technology reduced the temperature within an elevator by 2 degrees Celsius (20% energy saving).

Contact: Mr. Katsuo YAGISAWA k-yagisawa@fumin.jp

GAINA Pro Co., Ltd., NISSIN-SANGYO CO., LTD.

Energy saving and energy storage

A Multi-functional Ceramic Coating Material

Target Area

Energy efficiency

Technology

GAINA is a unique paint that can provide strong insulation effect just by painting it. By providing insulation, it helps to reduce energy cost. The product originated from the technology developed at the Japan Aerospace Exploration Agency (JAXA) for H-IIB type rocket development.

Sample Projects

The shipping of GAINA started in 1999, and the cumulative shipping quantity is 627,390 cans in 2018.

Contact: NISSIN-SANGYO CO., LTD. Inquiry@gaina.co.jp

Hitachi Metals, Ltd.

Energy saving and energy storage

Amorphous Energy Efficiency Distribution Transformer

Target Area

Energy loss in conventional transmission and distribution system

Technology

Metglas® amorphous metal distribution transformers (AMDTs) with up to 80% lower core loss than conventional ones increase efficiency of energy transmission and distribution. They contribute to energy saving of distribution grids and reduction of CO₂ emissions.

Sample Projects

This technology was developed in the 1970s, and AMDTs started to be used in the 1980s. They have been used in many countries such as Japan (410,000 units), USA (420,000 units), China (385,000 units), India (800,000 units), Mexico (65,000 units), Brazil (60,000 units) and the Republic of Korea (80,000 units).

NEW

IHI Corporation

Renewable energy, Utilization of unused resources

Biomass Gasification Plant: TIGAR® (Twin IHI GASifieR)

Target Area

Application of biomass

Technology

TIGAR® gasifies biomass resources such as wood chip and pellet to produce syngas (synthetic gas: hydrogen, carbon monoxide and other usable gases) by water-gas shift reaction. Syngas can be effectively utilized for various applications such as chemical feedstock and power generation fuel. By converting unutilized resources into a high-value product, TIGAR® reduces a large volume of CO₂ emission and provides a new clean energy solution.

Sample Projects

The installation and demonstration project to operate for nearly 6,000 hours completed. IHI Corporation is ready to export TIGAR® for commercial purposes.

Contact: Ms. Akira SHIMADA akira_shimada@ihico.jp

JAG SEABELL CO., LTD.

Renewable energy

Micro Hydropower System (ultra-low head)

Target Area

Hydroelectric power generation; Ultra low head environment

Technology

The STREAM is a run-of-river micro-hydropower generating system that can generate electricity especially in ultra-low head situations. Due to its compact size and ease of installation (typically two day installation and commissioning days in Japan), the system is especially suited for de-centralized power generation. Unlike conventional small hydropower schemes, a power channel, a powerhouse and penstock delivery are not necessary.

Sample Projects

Since 2008, the company has installed over 20 units in Japan and a pilot system in northern India.

Japan Insulation Co., Ltd.

Energy saving and energy storage
[Environmental Technologies: Circular Economy]

Thermal Insulation Materials Using Biomass

Target Area

Waste reduction

Technology

Japan Insulation has created a technology that uses biomass (rice husks) as a raw material and fuel in order to produce thermal insulation materials.

Sample Projects

The thermal insulator can cover the pipes and equipment contained in industrial plants, such as power, refinery and chemical plants. It keeps heat from escaping, improving the energy efficiency of the plant and helping the environment. Not only is the material non-combustible, but it is also lightweight and environmentally friendly.

NEW

KITA MACHINERY Co.,Ltd.

Renewable energy

Design and Construction of Small Hydropower Generation

Target Area

Regional electrification

Technology

A micro hydropower system developed by KITA MACHINERY is providing not only excellent machines but also the know-how in understanding the site conditions, selection of equipment and parts, design and installation method. Based on the know-how, we can make an optimal suggestion for local needs and conditions. Parts and equipment can be operated with less maintenance, which can help local people to operate by themselves. After installation, operating cost is very low.

Sample Projects

For the past five years, this micro hydropower system was installed in the Philippines (1 unit), Myanmar (5 units) and El Salvador (1 unit, for experimental use)

Nanotechnology & Industrial Coatings

Target Area

Excessive temperature stress in building; Accumulation of dirt on roofs, walls and others

Technology

This product will reduce excessive temperature stress for people in buildings, households, and factories, and will protect crops in warehouses, goods in containers, and passengers in buses. Heat cutting paint will bring down temperatures by over 10°C on roofs and gas/oil tanks. Dust repelling function coated on painted surfaces will protect the heat cutting function from deterioration or accumulation of dust or dirt.

Sample Projects

The product has been in the market for 5 years and used by Japan Railways for 3 years.

Renewable energy

Mid-Size Wind Turbine "KWT300" (300kW)

Target Area

Supply of electricity to power stations and existing facilities

Technology

The KWT300 is one of the very few high-spec, mid-size wind turbines available in the world. With 6.5m/s of annual average wind speed, one unit of wind turbine generates 600MWh/year, which is equivalent to the annual electricity use of 160 households. The KWT 300 is highly adaptable to the conditions of developing countries because of its flexibility (easy transportation, construction and various applications) and safety conscious design (strong, stable, and resistant to extreme winds, lightning and earthquakes).

Sample Projects

A prototype was installed in Japan and is operational since 2006. In 2010, one unit and technical training services were provided to the Wind Energy Technology Center in Mexico, established by UNDP and the Electric Research Institution of Mexico. In 2012 and 2013, 3 more units were installed in Japan.

KYOCERA Corporation

Renewable energy

Photovoltaic Module / Solar Hybrid System

Target Area

Difficulties of managing hybrid renewable energy systems

Technology

The company provides a solar hybrid system that can integrate photovoltaic solar panels with diesel generators or other renewable energy sources. The key technologies are the reliable and durable photovoltaic modules and electrical control of the hybrid system.

Sample Projects

Since 2009, Kyocera has supplied photovoltaic power generation systems with a capacity of 3,000kW or more not only within Japan, but also in other countries. The company has introduced the system with a capacity of less than 1MW without batteries to Spain, Thailand, Mongolia, Syria, Palau, Djibouti, Maldives, Marshall Islands, Tajikistan, USA, and Thailand.

Nabell Corporation

Renewable energy

Portable Solar Power Charge and Storage System

Target Area

Electricity generation in remote areas

Technology

The nanoGrid is a portable solar power system that can generate and store electric power from sunlight and AC power supply. It features superior weather resistance and is ideal for non-electric power source areas.

Sample Projects

The solar power system which consists of nanoGrid_2 (solar panel) and FSP type1000 (lithium-ion battery) was installed to Japanese Red Cross Society.

Nakayama Iron Works, Ltd.

Renewable energy

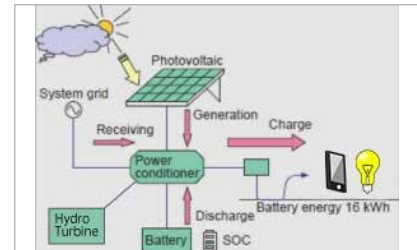

Pico and Micro Hydropower Systems

Target Area

Hydroelectric power generation

Technology

The micro turbine is a matured technology. This system features advantages such as low manufacturing cost, a reliable and stable electric control panel system, and reduced power generation cost, in comparison to conventional power generation systems.

Sample Projects

The company implemented small community development projects in Japan in 2012 and 2014. A more affordable technology was established and successfully implemented in collaboration with the Indonesian Small Hydropower Association. Additionally, the company has been proceeding with a small hydropower project in India since 2012 with JAG Seabell Co., Ltd. through OEM to provide turbines for hydropower generation.

NGK INSULATORS, LTD.

Renewable energy, Energy saving and energy storage

Sodium Sulfur Battery System

Target Area

Energy storage

Technology

Sodium Sulfur Battery System technology -- NAS[®] battery -- is currently the only commercially mature, large-scale energy storage technology that can be installed anywhere. It can be used for peak shaving, load leveling, and emissions reductions. From large capacity and high-energy density to long life and small size, there are many advantages to this technology.

Sample Projects

The current total worldwide installed capacity (including under construction) of NGK's NAS battery systems is approx. 525 MW (3,560MWh), as of March 2018, including 360MW in Japan, 37MW in Europe, 20MW in North America and 108MW in UAE.

Rechargeable Solar LED Lantern

Target Area

Lack of electricity

Technology

This rechargeable solar LED lantern is a multifunctional portable lantern that can be used as lighting, as a battery charger and as a solar panel. It comes with a 3.5W solar photovoltaic panel, which can fully recharge the waterproof lantern in 6 hours in fine weather. The batteries can be recharged more than 1,500 times. The LED lifespan is more than 10 years.

Sample Projects

Recharging system of the lantern is performed by Panasonic's Ni-MH battery, which has been increasingly sold and distributed in Japan since 1990.

Plastic waste; E-waste; Medical waste; Energy needs

Technology

A thermal decomposition plant called the “plastic to oil machine” can manufacture liquid fuel, combustible gas, and carbonized products from plastic wastes, E-wastes, waste tires, waste toners, medical wastes and crude-oil derived products. The machine has the advantages of easy operation, low fuel consumption, and production of high quality heavy and light oils.

Sample Projects

This technology has been adopted by more than 15 plants in Japan and introduced to Vietnam since 2013, Saudi Arabia since 2014, Indonesia since 2014, and China since 2015.

Sumino Co., LTD

Micro Hydraulic Power Unit (Spiral Type Pico-Hydro Unit)

Target Area

Renewable Energy

Technology

Spiral PicoPica Hydraulic Power Unit is a promising pico-hydro power generation equipment which has potential for dissemination in non-electrified areas, with its characteristics including low-head generation and dust-resistance. “PicoPica10” is a small 10W unit, and “PicoPica500” is a 500W unit which generates enough energy for an average Japanese household.

Sample Projects

Since 2011 to date, 500 sets of PicoPica10 have been sold in Japan.

PicoPica500 was released on December 2017 and it has already been placed in Nikko City, Tochigi Prefecture, Japan.

TBM Co., Ltd.

FOG-green Power Generation System

Target Area

Fats/Oil/Grease treatment from wastewater

Technology

Wastewater derived from daily preparation and consumption of foods contains a lot of fats, oils and grease (FOG). TBM Co., Ltd. has two innovative techniques to reuse FOG: 1) Technique for the perfect separation and collection of FOG from wastewater, 2) Reforming technique of collected FOG to produce a new bio fuel for electricity generators.

Sample Projects

Since its opening in April 2017, the FOG-green power generation system's power plant in Saitama prefecture generates 100KW x 24 hours x 365 days. In addition, we are proceeding the installation of our green power plants in various municipalities: Yokohama city, Tokorozawa city and Toshima-ku of metropolitan Tokyo.

Power Router for ECONETWORK

Target Area

Energy loss in conventional electric distribution systems

Technology

Power Router (PR) controls the electricity flow from one cluster to another cluster autonomously. ECONETWORK, which stands for Electricity Cluster Oriented Network, is a new architecture for electric distribution that makes the massive deployment of renewable energy sources available. PR consists of two inverters and a battery and accommodates the excess and shortfall of electricity transfer among clusters, without expensive telecommunication lines, thus contributing to the reduction of cost and complexity of electrification.

Sample Projects

Computer simulation with Waseda University showed that the concept worked as designed. Laboratory test of the twin inverters function has been conducted with Osaka Gas & Waseda University, and resulted in proving the concept & simulation.

Micro-Sizer: Glass Cullet Production Equipment

Target Area

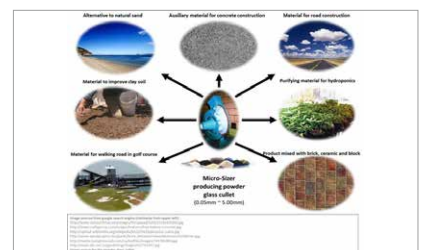

Glass waste

Technology

The Micro-Sizer is unique and more efficient equipment than the conventional hammer crusher and mill for crushing wasted glass because of its compact dry process, as well as efficient impurity separation process. The Micro-Sizer can produce about 3 tons of glass cullets per hour (up to the powder size of 0.05mm), resulting in glass cullets which can be used for multiple purposes; for example, as alternative materials for natural sand in beach areas suffering from coastal erosion, or as materials for making bricks, ceramics and blocks.

Sample Projects

Since 1995, the company has been successfully developing business especially in the USA and Japan. About 20 Micro-Sizers have been successfully installed in the USA. In the Japanese market, the company sold about 10 Micro-Sizers to various organizations including glass cullet manufacturers, glass-related companies as well as local governments.

EcoClean and GreenClean Series for Bioremediation

Target Area

Soil and groundwater contamination

Technology

The bioremediation products "EcoClean" and "GreenClean" perform in-situ bioremediation or purification of soil and groundwater contaminated with chlorinated hydrocarbons and heavy metals, and petroleum hydrocarbons cyanide compounds respectively. Both products are diluted in water and injected into sub-surfaces to stimulate native microorganisms in a contaminated site. Most contaminated sites can be cleaned in the span of a few months, which requires low energy and mediation cost.

Sample Projects

Bioremediation products have been applied for cleaning over 170 sites contaminated with chlorinated aliphatic hydrocarbons, chromium (VI), petroleum hydrocarbons and cyanide in Japan, USA, Taiwan, and other Asian countries.

Integrated Ethanol Production System Utilizing Biomass

Target Area

Bioethanol production

Technology

The company's integrated fermentation/distilling production system allows for turning food scraps into ethanol thus creating new value from what was once considered as wastes. This system allows for manufacturing ethanol utilizing a variety of biomass not only limited to high sugar content materials such as corn and sugar cane. Besides, fermented materials obtained as byproducts can be utilized for animal feed and fertilizer. This technology can provide a sustainable resource recycling system that minimizes waste.

Sample Projects

The company conducted fermentation experiments with more than 10 types of biomass materials such as rice for non-human consumption or vegetable and fruit waste, all of which were successfully converted into ethanol. The rice ethanol production facility has already been under commercial operation in Japan. Ethanol derived products (aroma products and cosmetics) are sold in major department stores and cosmetic stores.

Mercury Waste Recycling Technology

Target Area

Mercury pollution

Technology

The company has invented an all-inclusive facility that has the capacity to recycle, treat and process a wide variety of mercury waste from fluorescent lamps, batteries, mercury blood pressure devices, and thermometers. Through a roasting process, mercury is heated at 600°C~800°C, until it vaporizes. Afterwards, the mercury vapor flows through a cooling tower and scrubber where it is recovered. Recovered materials (mercury, glass, metallic base, fluorescent powder, etc.) can be recycled into raw materials to be used again for other products.

Sample Projects

Since its establishment in 1973, the company has specialized in treating, processing and recycling mercury waste. The company treated more than 25,000 tons of mercury waste every year between 2011 and 2013 in Japan. The company has also imported and treated uncrushed lamps from the Philippines from 2002 to 2014 and from Taiwan from 2006 to 2014.

Asphalt Waste Recycling Technology

Target Area

Recycling of asphalt pavement material

Technology

This is a technology to repair roads at a lower cost and with lower environmental impact than conventional methods. It can reduce the use of new pavement materials by recycling reclaimed asphalt pavement (hereinafter called the "RAP"), which is generated when roads are repaired, to synthesize recycled asphalt mixtures and to use those mixtures again to pave roads. It can reduce the cost by 5% compared to the conventional method and the CO₂ emission reduction to be approximately 7kg-CO₂/ton-asphalt, although the effect varies depending on the RAP transportation distance.

Sample Projects

The company has already constructed an asphalt recycling plant in Karawang, West Java Province, Indonesia, and has a track record of selling recycled asphalt mixtures mainly for paving roads to private premises such as industrial parks with a recycling rate of 40% for surface layers and 50% for base layers.

SF Double-Wall Tank

Target Area

Pollution prevention

Technology

The company manufactures SF (steel and fiber reinforced plastic) double-wall tank, which is an underground tank for storing liquid fuel and chemical products. It is designed for installation at gas stations and other facilities that store hazardous materials. Utilizing proprietary technology, this double-wall structure is comprised of a primary steel tank and a secondary FRP tank.

Sample Projects

A number of countries, including Japan, require SF double-wall tanks as a part of their environmental conservation regulations. The technology has been shared in China, Thailand, Malaysia and Vietnam.

Photocatalytic Deodorization System: "PCF® Hybrid"

Target Area

Deodorization by photocatalytic reaction

Technology

PCF® Hybrid is a purification system for exhaust air with malodor or nasty smell. It has been proved to remove 92% of Acetaldehyde (stimulating greenery smell), 93.5% of Methyl Mercaptan (rotten onion smell) and 94% of Toluene (gasoline smell). As the deodorization effect is occurred by UV irradiation to photocatalytic filters, less additional costs of expendables are necessary whereas filters utilizing activated carbon or other deodorants need to be purchased to refill.

Sample Projects

440 sets of products have already been installed to 206 sites in Japan. Shopping malls, schools, laboratories, resort hotels, processing food plants, and school canteens use our products. In addition, the company has a plan to export products to Vietnam, China and Taiwan.

Merry's System: Food Waste Composting and Creating Recycling Loop

Target Area

Food Waste

Technology

Merry Corporation provides an effective solution to food waste, by constructing a community-based composting system. The composting center equipped with food waste recycling facility operated by Merry Corporation collects food wastes and produces compost in a composting machine. Then the compost is used for cultivation of rice and vegetables in neighboring farmlands.

Sample Projects

Merry Corporation has been operating the composting center in Kitakyushu city since 2015. It produces 80 tons of compost per year and supplies the compost to local farmers.

Other than the one in Kitakyushu, 588 composting machines had been sold until 2018.

High durability film "F-CLEAN™" for greenhouse

Target Area

Agriculture

Technology

This product "F-CLEAN™" is a highly durable film for use in greenhouses which allows users to grow high-quality and high value-added crops, within a variety of applications. The film has a low surface tension, allowing dirt to get washed away more readily by rain and snow. Also, there are different types of F-CLEAN™ films for different applications.

Sample Projects

Since 1985, 4,000 ha of "F-CLEAN™" has been sold in total. Projects widely vary in size, from 300 m² to 200,000 m². The film has been installed in more than 20 countries including Guatemala, Russia and Egypt.

Special Ice Maker from Salty Water: sea snow

Target Area

Cold chain

Technology

The “sea snow” produces snow-like ice from seawater or salty water. It enables to keep fishery products very fresh by storing products refrigerated at -1℃ with 1% salt concentration, which is almost identical to that of the fluid inside fish bodies. Also, it helps to prevent scratches and damage to the fish’s body during delivery. Moreover, it has an advantage in water conservation by using seawater instead of tap water so that it will contribute to reducing running costs.

Sample Projects

It has already been used in South Korea to maintain the freshness of common dolphinfish, which is difficult to maintain freshness especially in fishing boats and fishing ports.

Drinking Water Quality Analysis Technology

Target Area

Analysis of water quality

Technology

This technology performs monitoring of water quality to make sure that drinking water treatment systems work properly. It measures and analyzes turbidity, color and residual chlorine contained in potable water. The technology is especially used to monitor fiber membrane technologies as it can detect fiber break leakages that conventional detection methods overlook, and also finds pathogens, such as cryptosporidium. By digitally displaying the processed liquid state in membrane filtration processes, it can contribute to better yields and savings on utilities.

Sample Projects

The technology has proven to be effective since 2004. Over 1,000 units are currently operational at public drinking water treatment plants all over Japan.

Bicycle-Powered Water Purifying Equipment

Target Area

Water purification; Lack of water

Technology

This technology can make clean drinking water from raw water, such as water obtained from rivers, lakes and swimming pools, without need for electrical power. A unit made up of a microfiltration membrane, a hybrid carbon filter and a primary filter is fixed at the rear seat of a custom-made stationary bicycle, allowing users to produce clean water by just working the bicycle pedals. The technology can produce 5 liters of water per minute.

Sample Projects

The company's water purifying bicycle has been sold to condominiums, old age care homes, laboratories and municipal offices in Japan, and also in Bangladesh, Indonesia, Myanmar, the Philippines, China, Thailand and India.

Old Faithful Japan Co., Ltd.

Clean Move

Target Area

Water contamination from cleaning materials

Technology

Clean Move is an all-natural and multiple-purpose detergent for washing and cleaning a variety of objects such as tableware, clothing, buildings, cars, baby's diapers, baby bottles, etc. It is also cost effective and easy to manufacture.

Sample Projects

The technical transfer costs 15 million yen, which includes the cost for the three-day hands-on training conducted in Japan, one manufacturing machine and a complete set of equipment necessary for the production.

Hypochlorous Acid Type Disinfectant: JIAT X KIREIKUKAN

Target Area

JIAT X is an anti-bacterial and deodorant solution that supersedes alcohol, and perfectly

Technology

harmless to humans and animals. The product uses a special method that enables the manufacture of the product just by utilizing sodium hypochlorite (NaClO). They offer excellent functionality at a reasonable price compared to other competitive products. They can also offer a concentrate (around 600ppm of available chlorine) to be diluted when using.

Sample Projects

The number of monthly sales in spray bottles exceeded 10,000. Moreover, the potential market of JIAT X is widely spreading to places where an unspecified number of people gather, such as public transportation, hospitals, schools, and many other facilities.

Monitoring and diagnostic equipment

Portable Electrolyte Analyser: STAX-5 inspire

Target Area

Diagnosis and health monitoring

Technology

STAX-5 is a Point-of-Care Testing analyzer for in vitro diagnostic use by health care professionals. It enables us to examine cNa⁺, cK⁺, cCl⁻, cCa²⁺, cMg²⁺, pH, pCO₂ (partial pressure of CO₂), Hct (hematocrit) easily and rapidly by using the disposal sensor card with only 10 microliters of blood. Besides medical use, it can also be used for the measurement and quality control of fertilizer concentration in hydroponics in the agricultural field.

Sample Projects

STAX-5 is the 4th generation of the company's electrolyte analyzer that has been marketed in 2014. In developing nations, the product is exported to Afghanistan, Bangladesh, Egypt, India, Nepal, and Pakistan through sales agents.

Yamaha Motor Co., Ltd.

Clean Water Supply System for Rural Areas

Target Area

Water, Sanitation and Hygiene (WASH)

Technology

Yamaha's Clean Water Supply System is a water purification facility using slow sand filtration intended to provide rural residents with clean drinking water. As most rural areas are not yet connected to an electrical grid, a solar photovoltaic system is available within the same package to provide the power source. This system significantly contributes to sanitation and health conditions.

Sample Projects

The system has been operated since 2003. To date, 16 units have been installed in Indonesia and other ASEAN nations, and 27 units in Senegal, Madagascar and other African countries. In Ethiopia, the company installed 1 facility in the project organized by UNIDO.

Photocatalyst Titanystar

Target Area

Water treatment

Technology

Yield Co., Ltd. has the technology to clean undrinkable water to make safe drinking water through the use of a photocatalyst. The photocatalyst found in Japan has excellent purification abilities to decompose and remove most harmful substances simply by receiving ultraviolet rays. Disinfectant for water such as chlorine and ozone becomes unnecessary, and chemical-free and clean drinking water can be provided.

Sample Projects

Number of sales in Japan reaches to a cumulative total about 30,000 pieces or more since the year 2000.

For overseas, a cumulative total of about 2,000 pieces have been sold to France, UK, Russia, New Zealand, Singapore, Malaysia, India and Taiwan since the year 2004.

Energy Technologies

- Renewable energy (ex: solar, wind, geothermal, small hydro, biomass)
- Energy saving and energy storage (ex: co-generation, storage batteries, energy saving)
- Utilization of unused resources (ex: high-efficiency and low-emission fossil fuel utilization)

Environmental Technologies

- Pollution prevention and control (ex: pollution prevention of air, water and soil)
- Waste treatment and management (ex: industrial and municipal waste treatment)
- Circular economy (ex: 3R (reduce, reuse, recycle) related technologies)

Agribusiness Technologies

- Food value chain^{*1} (ex: processing and quality control of food and drinks)
- Production enhancement (ex: soil conditioner)
- Adaptation to climate change (ex: drip irrigation system)
- Water resource management (ex: desalination, fresh water storage)

Human Health Technologies^{*2}

- Public health (ex: drinking water supply, prevention of infection, toilets)
- Monitoring and diagnostic equipment (ex: simple equipment for health monitoring in remote areas)

*1: Processing, transportation, preservation or quality control of acceptable, except for real foods and drinks (beverages).

*2: It excludes pharmaceuticals, highly invasive medical devices for the human bodies, and folk remedies, etc.
